Name: Ritchie Conrad Hoo

Group: KarlOS

Assigned Role: File Management, Process, and Memory Developer

What did I contribute to the project?

- I contributed in the development of the 3 Feature needed in our MiniOS. Which are File Management and Process and Memory Developer.

What features did I personally develop?

- I developed the File Management, and as well as the Process and Memory Management of our system.

What problems did I encounter?

- The Problem I first encountered was how to link the multiple pythons our CLI and System developer made.
- The next problem was figuring out the logic for the respective features.

How did I solve those problems?

- I studied the code that sent by out CLI and System developer, figured out how each of these python files were connected and constructed to function. After I learned the structure, I added the features (File Management and Process and Memory Management) by creating separate python files, renaming and storing their logic there, and created classes and commands in kernel.py and shell.py files.

What did I learn from this project?

- I learned and recalled the importance of Objected Oriented Programming. I knew there was going to be a lot of def functions involved, and it was up to us a group to layout the structure. With the use of OOP, it was much easier to navigate and store blocks of repeating without repetition

Evidence of my contribution:

-
